NATURAL VIBRATIONS OF LONGITUDINALLY STRENGTHENED CYLINDRICAL SHELLS WITH AN ELASTIC FILLER

Jalolov Farruh Baxshullaevich

Asia International University, teacher of the "General Technical Sciences" department

Abstract: In the work, using the variational theory, the oscillations of a thin long reinforced round shape with dynamic wave filling, with axial assistance and taking into account friction in contact were investigated. They were constructed depending on the period of natural oscillation from wave formation in the circumferential direction taking into account friction in contact between the shell and the filling. It was established that the results of the study practically do not depend on the characteristics of the material, since the dependence of the frequency on the Poisson ratio does not depend on the modulus of elasticity.

Keywords: connection, joint, modulus of elasticity, deformation, total energy, coefficient of friction.

Introduction. Cylindrical shells with various fillers are widely used in various branches of mechanical engineering. This, in turn, requires a more complete consideration of the characteristics of materials and structures for the purpose of rational design and reliable strength calculations. For a more reliable description of the bearing capacity of a structure, it is advisable to take into account the forces of external action from the filler. One of such effects is its contact with the elastic medium. The forces of external action from the filler are essentially surface forces and are caused by the contact between the shell and the elastic filler. The contact is complex and depends on various factors: mechanical parameters of the filler, the surface of the shell, etc. One of the main factors is the friction forces caused by the interaction of the shell with the filler. The solution of this type of problem is associated with a number of mathematical difficulties, aggravated by the need to take into account dynamic effects in problems of seismic resistance, vibration, etc., often encountered in technical calculations and modeling. Thus, the relevance of developing approximate methods for this type of calculations is obvious, which is, in particular, the variational method considered in this article. This is also explained by the fact that the method allows developing consistent approximate principles of the theory of thin-walled structures such as shells and rods. It should be noted that the solutions described in the scientific literature relate mainly to a reinforced cylindrical shell without a filler [1-3]. Vibrations of smooth cylindrical shells with a filler are studied quite fully in [4-7]. In [8-10], vibrations of cylindrical shells reinforced with longitudinal ribs and filled with an elastic medium are studied. **Methods.** This article is devoted to the study of free vibrations of cylindrical shells with a filler, reinforced by discretely distributed longitudinal systems of ribs under axial compression and taking into account the friction between the shell and the filler. An analysis of the influence of environmental parameters on the parameters of the natural vibration frequency of the system is carried out. The problem is solved by an energy method. The potential energy of a shell loaded

INTERNATIONAL JOURNAL OF SCIENTIFIC RESEARCHERS **ISSN: 3030-332X Impact factor: 8,293 Volume 8, issue 2, November 2024 <https://wordlyknowledge.uz/index.php/IJSR> worldly knowledge** *Index: google scholar, research gate, research bib, zenodo, open aire. https://scholar.google.com/scholar?hl=ru&as_sdt=0%2C5&q=wosjournals.com&btnG* **<https://www.researchgate.net/profile/Worldly-Knowledge> <https://journalseeker.researchbib.com/view/issn/3030-332X>** with axial compressive forces has the form [11-12]: $-2(1-v)$ $\frac{v}{2r^2}$ $\frac{v}{2r^2} + \frac{v}{2r}$ $-\frac{1}{4}$ $\frac{v}{2r^2} + \frac{v}{2r}$ $d\xi d\theta$ + (1) $\frac{3}{5}$ V is a set of \overline{V} θ 4 $\partial \xi \partial \theta$ $\partial \xi$ ζ $V \quad \begin{array}{ccc} \end{array}$ $C^W \quad \begin{array}{ccc} \end{array}$ $C^W \quad \begin{array}{ccc} \end{array}$ $C^W \quad \begin{array}{ccc} \end{array}$ v) $\frac{\partial^2 w}{\partial \xi^2} \frac{\partial^2 w}{\partial \theta^2} + \frac{\partial v}{\partial \theta} - +\frac{E_c}{2R}\int_{l=1}^{k-\xi_1} F_c \frac{\partial u}{\partial \xi} - \frac{h_c}{R}\frac{\partial^2 w}{\partial \xi^2}^2 + \frac{I_{yc}}{R^2}\frac{\partial^2 w}{\partial \xi^2}^2 + \frac{G_c}{E_c}I_{kpc} \frac{G_c}{E_c}I_{kpc} \frac{\partial^2 w}{\partial \xi \partial \theta} + \frac{\partial v}{\partial \xi}^2 \frac{d\xi}{\partial \xi} - \frac{\sigma_x h}{2} \frac{\delta w}{\delta \xi}^2 \frac{d\xi d\theta}{d\xi} - \frac{\sigma_x F_c}{2R}\int_{l=1}^{k-\xi_1} \frac{\partial w}{\partial \xi}^2 \frac{d\xi}{d\xi} d\xi
$$

Here $\xi_1 = \frac{L}{R}$, $\xi = \frac{x}{R}$, $\theta = \frac{y}{R}$; x, y,z- coordinates, E_c , G_c - elasticity and shear moduli of the longitudinal ribs material, k – number of longitudinal ribs, σ_x - axial compressive stresses, u, v, w - components of the shell displacement vector,h and R – the thickness and radius of the shell, respectively, E, v - Young's modulus and Poisson's ratio of the shell material, F_c , I_{yc} , $I_{kp.c}$ - respectively, the areas and moments of inertia of the cross-section of the longitudinal rod relative to the axis ОХ and ОZ, and also the moment of inertia during torsion. The kinetic energy of the shell is:

$$
K = \frac{Eh}{2(1 - v^2)} \int_{0}^{\xi_1 2\pi} \frac{\partial u}{\partial t_1}^2 + \frac{\partial v}{\partial t_1}^2 + \frac{\partial w}{\partial t_1}^2 d\xi d\theta
$$

+
$$
\frac{\overline{\rho_c}E_cF_c}{2R(1 - v^2)} \Big|_{t=1}^{k_1} \frac{\partial u}{\partial t_1}^2 + \frac{\partial w}{\partial t_1}^2 d\xi
$$

$$
\theta = \theta_1
$$
 (2)

Here $\rho_c = \frac{P_c}{r}$, were $\rho_{\scriptscriptstyle 0}$ $\overline{\rho_c} = \frac{\rho_c}{r}$, were ρ_0 , ρ_c - the densities of the shell and longitudinal rod materials, 2π .

respectively,
$$
\theta_i = \frac{2\pi}{k_1} i
$$
.

The interaction of the filler with the shell is represented as a surface load applied to the shell, which performs work on the displacements of the contact surface when transferring the system from a deformed state to the initial undeformed state.

$$
A_0 = -\int_{0}^{\xi_1 2\pi} (q_x u + q_\theta v + q_z w) d\xi d\theta + \int_{0}^{\xi_1 2\pi} f q_z (u + v) d\xi d\theta
$$
 (3)

were q_x, q_θ, q_z - pressure from the filler on the shell, f – coefficient of friction. The total energy of the system is:

INTERNATIONAL JOURNAL OF SCIENTIFIC RESEARCHERS **ISSN: 3030-332X Impact factor: 8,293 Volume 8, issue 2, November 2024 <https://wordlyknowledge.uz/index.php/IJSR>** worldly knowledge

 $\Pi = \partial + K + A_0$

(4)

The equation of motion of the medium in vector form has the form $[2,3]$: a_e^2 *qrad div* $S - a_t^2$ *rot rot* $S + \omega^2 S = 0$, $0 \le X \le L$, $0 \le T \le R$ (5)

Were $a^2_t = (\lambda + 2\mu)/\rho$, $a^2_e = \mu/\rho$, a a_t , a_e - the propagation speeds of longitudinal and transverse waves in the filler, respectively; $S = S(S_x, S_{\theta}, S_z)$ - displacement vector; λ , μ - Lame coefficients. Contact conditions are added to the systems of equations of motion of the medium (5). It is assumed that the contact between the shell and the filler is rigid, i.e. when $r = R$: $u = S_x$; $v = S_\theta$; $w = S_z$ (6)

$$
q_x = -\sigma_{rx}, q_y = -\sigma_{r\theta}, \quad q_z = -\sigma_{rr}, w = S_r \tag{7}
$$

Components $\sigma_{rx}, \sigma_{rq}, \sigma_{rr}$ - stress tensors are defined as follows [13-15]:

$$
\sigma_{rx} = \mu_s \frac{\partial S_x}{\partial r} + \frac{\partial S_r}{\partial x} \; ; \; \sigma_{r\theta} = \mu_s r \frac{\partial}{\partial r} (\frac{S_r}{r}) + \frac{1}{r} \frac{\partial S_r}{\partial \theta} \; ,
$$
\n
$$
\sigma_{rr} = \lambda_s \frac{\partial S_r}{\partial x} + r \frac{\partial}{\partial r} (\frac{S_r}{r}) + \frac{1}{r} \frac{\partial S_\theta}{\partial \theta} + 2\mu_s \frac{\partial S_r}{r}
$$
\n(8)

 λ_s , μ_s - Lame coefficients for the environment.

Supplementing the equations of motion of the filler (5) with contact conditions (6) and (7), we arrive at a contact problem of vibrations of a cylindrical shell reinforced with cross-rib systems filled with a medium. In other words, the problem of vibrations of a cylindrical shell with a filler reinforced with cross-rib systems under axial compression is reduced to the joint integration of the equations of shell theory and the equations of motion of the filler when the specified conditions are met on the surface of their contact.

Further, we will consider shells whose edges are hinged. We seek the components of the displacement vector of such shells in the form:

(9)

$$
u = A \cos kx \cos n\varphi \exp(i\omega_1 t_1),
$$

\n
$$
\vartheta = B \sin kx \sin n\varphi \exp(i\omega_1 t_1),
$$
 (9)

$$
\mathcal{G} = B \sin kx \sin n\varphi \exp(i\omega_1 t_1),\tag{9}
$$

 $w = C \sin kx \cos n\varphi \exp(i\omega_1 t_1)$ $1^{\iota}1^{\jmath}$

Where, A, B, C – unknown constants; $k = \frac{mx}{x}$ ($m = 1,2,...$), m, n - wave numbers in the *L* $k = \frac{m\pi}{r}$ (*m* = 1,2,....), *m*,*n* - wave numbers in the

longitudinal and circumferential directions, respectively, *L*- length of the shell,

$$
\omega_1 = \frac{\omega}{\omega_0}, \quad t_1 = \omega_0 t, \quad \omega_0 = \sqrt{\frac{E}{(1 - v^2)\rho_0 R^2}}, \quad \omega_1 = \sqrt{\frac{(1 - v^2)\rho_0 R^2 \omega^2}{E}}
$$

For equal weights of the reinforced shell and the shell without reinforcement, their natural frequencies are denoted by ω and ω_0 .

The solutions of system (5) have the form $[4, 15]$:

a) with small inertial effects from the filler on the process of system oscillations:

$$
S_x = -kr \frac{\partial I_n(kr)}{\partial r} - 4(1 - v_s)kI_n(kr) A_s + kI_n(kr)B_s \cos n\varphi \cos kx \exp(i\omega_1 t_1)
$$

$$
S_{\varphi} = -\frac{n}{r} I_n(kr) B_s - \frac{\partial I_n(kr)}{\partial r} \gamma_1 r) C_s \sin \varphi \cos kx \exp(i\omega_1 t_1)
$$

(10)

(11)

ISSN: 3030-332X Impact factor: 8,293 Volume 8, issue 2, November 2024 <https://wordlyknowledge.uz/index.php/IJSR> worldly knowledge

Index: google scholar, research gate, research bib, zenodo, open aire. https://scholar.google.com/scholar?hl=ru&as_sdt=0%2C5&q=wosjournals.com&btnG **<https://www.researchgate.net/profile/Worldly-Knowledge> <https://journalseeker.researchbib.com/view/issn/3030-332X>**

$$
S_r = -k^3 r I_n(kr) A_s + \frac{\partial I_n(kr)}{\partial r} B_s + \frac{n}{r} I_n(kr) C_s \cos n\varphi \sin kx \exp(i\omega_1 t_1)
$$
\n(10)

b) the inertial effects of the filler on the process of system oscillations are significant:

$$
S_x = A_s k I_n(\gamma_e r) - \frac{C_s \gamma_i^2}{\partial r} I_n(\gamma_1 r) \cos n\varphi \cos kx \exp(i\omega_1 t_1)
$$

$$
S_{\varphi} = -\frac{A_s n}{r} I_n(\gamma_e r) - \frac{C_s n k}{r \mu} I_n(\gamma_1 r) - \frac{B_s}{n} \frac{\partial I_n(\gamma_1 r)}{\partial r} \sin n\varphi \sin kx \exp(i\omega_1 t_1)
$$

$$
S_r = A_s \frac{\partial I_n(\gamma_e r)}{\partial r} - \frac{C_s k}{\mu_1} \frac{\partial I_n(\gamma_1 r)}{\partial r} + \frac{B_s}{r} I_n(\gamma_1 r) \cos n\varphi \sin kx \exp(i\omega_1 t_1)
$$
\n(11)

Here I_n - modified Bessel function of the nth order of the first kind, A_s , B_s , C_s - permanent. Using contact conditions (6), displacements of shells (9), solution of the equation of motion of the medium (10) and (11), we express the constants A_s , B_s , C_s through A , B_s , C_s . As a result, for $q \cdot q_{\alpha}$, *q* we find:

$$
q_x = (\widetilde{C}_{x1}A + \widetilde{C}_{x2}B + \widetilde{C}_{x3}C) \cos n\varphi \cos kx \exp(i\omega_1 t_1)
$$

\n
$$
q_{\theta} = (\widetilde{C}_{\theta 1}A + \widetilde{C}_{\theta 2}B + \widetilde{C}_{\theta 3}C) \sin n\varphi \sin kx \exp(i\omega_1 t_1)
$$

\n
$$
q_r = (\widetilde{C}_{x1}A + \widetilde{C}_{x2}B + \widetilde{C}_{x3}C) \cos n\varphi \sin kx \exp(i\omega_1 t_1)
$$
\n(12)

После подстановки (12) в (3) и интегрирования по ξ и θ получаем для работы распределенных нагрузок со стороны заполнителя, приложенных к оболочке:

$$
A = -R^{2}\pi \Big[S_{2}\widetilde{C}_{x1}A^{2} + (S_{2}\widetilde{C}_{x2} + S_{1}\widetilde{C}_{\theta 1})AB + (S_{2}\widetilde{C}_{x3} + S_{1}\widetilde{C}_{\theta 1})AC ++ S_{1}(\widetilde{C}_{\theta 3} + \widetilde{C}_{\theta 2})BC + S_{1}\widetilde{C}_{\theta 2}B^{2} + S_{1}\widetilde{C}_{\theta 3}C^{2} \Big]
$$
(13)
Here \widetilde{C}_{ra} - constant, $S_{1} = \frac{1}{2} - \frac{\sin 2k\xi_{1}}{4k}$.

Using (1), (2), (13) for the total energy of the system we obtain a second-order polynomial with respect to the constant parameters A,B,C:
 $\overline{H} = (\overline{\phi} - \overline{S} \overline{C} - W \overline{\phi}^2) A^2 + (\overline{\phi} - \overline{S} \overline{C} - W \overline{\phi}^2) B^2$

$$
\Pi = (\vec{\phi}_{11} - S_2 \vec{C}_{x1} - \psi_{11} \omega_1^2) A^2 + (\vec{\phi}_{22} - S_1 \vec{C}_{\theta 2} - \psi_{22} \omega_1^2) B^2 + + (\vec{\phi}_{23} - S_1 \vec{C}_{r3} - \psi_{33} \omega_1^2 + I_1 \sigma_x) C^2 +
$$

\n
$$
(\vec{\phi}_{44} - S_2 \vec{C}_{x2} + S_1 \vec{C}_{\theta 1}) AB + + (\vec{\phi}_{55} - S_2 \vec{C}_{x3} + S_1 \vec{C}_{r1}) AC + S_1 (\vec{\phi}_{66} + \vec{C}_{\theta 3} + \vec{C}_{r2}) BC
$$

\nNote that the quantities $\vec{\phi}_{ii} (i = 1, 2, \dots, 6), \quad \psi_{ii} (i = 1, 2, \dots, 6), \quad I_i (i = 1, 2)$ have a bulky appearance, so we do not include them here.

The conditions of the extremum P for the parameters A , B , C reduce the solution of the problem of vibrations of a shell reinforced by longitudinal systems of ribs filled with a medium and subjected to longitudinal compression, taking into account friction in contact, to homogeneous systems of linear algebraic equations of the third order, non-trivial solutions of which are possible only if the determinant of this system is equal to zero. Equating the determinants of the indicated systems to zero, we obtain the following frequency equation:
 $2(\tilde{\phi} - S\tilde{C})^2 + (\tilde{\phi} - S\tilde{C})^2 + (\tilde{\phi} - S\tilde{C})^2 + (\tilde{\phi} - S\tilde{C})^2 = 0$

$$
2(\vec{\varphi}_{11} - S_2 \vec{C}_{x1} - \psi_{11} \omega_1^2) A + (\vec{\varphi}_{44} + S_2 \vec{C}_{x2} + S_1 \vec{C}_{\theta 1}) B + (\vec{\varphi}_{55} - S_2 \vec{C}_{x3} + S_1 \vec{C}_{r1}) C = 0
$$

\n
$$
(\vec{\varphi}_{44} + S_2 \vec{C}_{x2} + S_1 \vec{C}_{\theta 1}) A + 2(\vec{\varphi}_{22} - S_1 \vec{C}_{\theta 2} - \psi_{22} \omega_1^2) B + (\vec{\varphi}_{66} + \vec{C}_{\theta 3} + \vec{C}_{r2}) C = 0
$$

\n
$$
(\vec{\varphi}_{55} + S_2 \vec{C}_{x3} + S_1 \vec{C}_{r1}) A + (\vec{\varphi}_{66} + \vec{C}_{\theta 3} + \vec{C}_{r2}) B + 2(\vec{\varphi}_{33} - S_1 \vec{C}_{r3} - \psi_{33} \omega_1^2 + I_1 \sigma_x) C = 0
$$
\n(14)

ISSN: 3030-332X Impact factor: 8,293 Volume 8, issue 2, November 2024 <https://wordlyknowledge.uz/index.php/IJSR> worldly knowledge

Index: google scholar, research gate, research bib, zenodo, open aire. https://scholar.google.com/scholar?hl=ru&as_sdt=0%2C5&q=wosjournals.com&btnG **<https://www.researchgate.net/profile/Worldly-Knowledge> <https://journalseeker.researchbib.com/view/issn/3030-332X>**

It is easy to see that in case a) the system of equations (14) is reduced to a cubic equation with respect to ω_1^2 , otherwise it is transcendental. Since in what follows we will be interested only in low frequencies of bending vibrations, this equation in case a) can be simplified by discarding the terms with ω_1^4 and ω_1^6 . B As a result we get $(\omega_1^2 = \lambda_a)$: $\lambda_1^2 = \lambda_a$):

$$
\lambda_{a} = \frac{f_{3}^{2} f_{4} + f_{1} f_{5}^{2} + f_{2}^{2} f_{6}}{2 f_{5}^{2} \psi_{11} + f_{2}^{2} \psi_{33} - 4 f_{1} f_{4} \psi_{33} - 0,5 f_{6} (f_{1} \psi_{22} + f_{4} \psi_{11})}
$$
\n
$$
f_{1} = \tilde{\varphi}_{11} - S_{2} \tilde{C}_{x1}; \ f_{2} = \tilde{\varphi}_{44} + S_{2} \tilde{C}_{x2} + S_{1} \tilde{C}_{\theta1}; \ f_{3} = \tilde{\varphi}_{55} + S_{2} \tilde{C}_{x1} + S_{1} \tilde{C}_{r1};
$$
\n
$$
f_{5} = \tilde{\varphi}_{66} + \tilde{C}_{\theta3} + \tilde{C}_{r2}; \ f_{6} = \tilde{\varphi}_{33} - S_{1} \tilde{C}_{r3} + I_{1} \sigma_{x}
$$
\n(15)

It is defined in a similar way λ_b for the occasion b).

Results and analysis. Let us present the results of the study of the influence of the number of ribs and the rigidity of the fillers on the critical stress of axial compression. The calculations were performed for the shell, medium and ribs with the following parameters:

$$
E = E_c = E_h = 6.67 \ 10^9 H/m^2; \ v = 0.3; \ x = 1; \ n = 8; \ h_h = 1,39 mm; \ R = 160 mm;
$$

$$
E = E_c = E_h = 6.67 \text{ 10}^{\circ} H/m^2; \ v = 0.3; \ x = 1; \ n = 8; \ n_h = 1.39 \text{ mm}; \ R = 160 \text{ mm};
$$
\n
$$
L_1 = 800 \text{ mm}; \ \frac{F_c}{2\pi R h} = 0.1591 \text{ 10}^{-1}; \ \frac{I_{yc}}{2\pi R^3 h} = 0.45 \text{ mm};
$$
\n
$$
F_x = 5.75 \text{ mm}^2; \ I_{sh} = 19.9 \text{ mm}^4; \ |h_c| = 0.1375 \text{ 10}^{-1} R; \ \frac{I_{kpc}}{2\pi R^3 h} = 0.5305 \text{ 10}^{-6};
$$
\n
$$
I_{kph} = 0.48 \text{ mm}^4; \ f = 0.25
$$

The calculation results are presented in Fig. 1. The dependence of the axial compression stress is shown here. From Fig. 1 it is evident that with increasing stress the frequency of the system decreases. In addition, taking into account friction leads to a decrease in the value of the natural frequency of the structure under study. As noted, the method for determining the optimal reinforcement parameters is based on a comparison of the minimum vibration frequencies of a ribbed and smooth cylindrical shell, reinforced by longitudinal rib systems filled with a medium. The following parameters are considered as variable: relative thickness of the shell $h^* = h/R$, distances between longitudinal and transverse ribs, related to the thickness of the shell ratio of the weight of all ribs to the weight of the shell φ_1 and the ratio of the weight of the longitudinal ribs to the weight of the transverse ribs φ_2 . It is assumed that the radius and length of the shell, as well as the characteristics of the shape of the sections of the longitudinal and transverse ribs are predetermined. Note that for rectangular sections it is necessary to specify the relations ψ_1 and ψ , heights of longitudinal and annular ribs to their thicknesses, respectively. The dimensionless characteristics of the ribs included in (1) , (2) are expressed through the specified parameters:

$$
\overline{\gamma^{(1)}}_c = \frac{\varphi_1 \varphi_2}{1 + \varphi_2}, \quad \overline{\gamma}_s^{(2)} = \frac{\varphi_1}{1 + \varphi_2}, \qquad \frac{h_c}{R} = -\frac{h^*}{2} (1 + \sqrt{a_1 \varphi_1 \overline{\gamma}_c^{(1)}}),
$$
\n
$$
\mu_{s2} = \frac{1 - v}{6} \frac{a_2}{\psi_2} (h^*)^2 (\overline{\gamma}_s^{(2)})^2; \quad \frac{h_c}{R} = -\frac{h^*}{2} 1 + 1 + \frac{1}{k_1} \sqrt{a_1 \varphi_1 \overline{\gamma}_c^{(1)}} ,
$$
\n
$$
\eta_{s1}^{(2)} = \overline{\gamma}_{s1}^{(2)} \overline{\gamma}_s^{(2)} \frac{a_2 \psi_2 (h^*)^2}{12}, \qquad \eta_{s1}^{(2)} = \overline{\gamma}_{s1}^{(2)} \overline{\gamma}_s^{(2)} \frac{a_2 \psi_2 (h^*)^2}{12},
$$
\n
$$
\eta_c^{(1)} = \overline{\gamma}_c^{(1)} \frac{a_1}{12} \psi_1 \overline{\gamma}_c^{(1)} (h^*)^2 + \frac{h_c}{R}^2, \qquad \mu_{s1} = \frac{1 - v}{6} (h^*)^2 (\overline{\gamma}_c^{(1)})^2 \frac{a_1}{\psi_1}
$$

With this formulation, the result of the study is practically independent of the characteristics of the shell material, since (ω_{min}^2) , as is known, weakly depend on Poisson's ratio v, and their attitude μ do not depend on the modulus of elasticity E . It should be noted that in order to improve the bearing capacity of the shell, it is necessary to find such a combination of parameters h^* , a_1 , a_2 , φ_1 and φ_2 , under which μ takes on the greatest value.

As an example to illustrate the changes μ Depending on the relative weights of the ribs, the results of calculations of cylindrical shells filled with a medium reinforced by longitudinally supported rib systems are presented.

Fig. 1. System frequency dependencies $\omega = \omega_1 \omega_0$ from compressive stresses

4. Conclusions

The results of the study are practically independent of the characteristics of the shell material, since (ω_{min}^2) weakly dependent on Poisson's ratio v, and their attitude μ do not depend on the modulus of elasticity *E* . It has been established that in order to improve the bearing capacity of the shell, it is necessary to find such a combination of parameters h^* , a_1 , a_2 , φ_1 u φ_2 _, under which μ takes on the greatest value.
