

**STUDY OF THE CHEMICAL PROPERTIES AND PROPERTIES OF DEFECATE  
SECONDARY PRODUCT, WHICH IS CHARACTERISTIC IN THE PRODUCTION  
OF SUGAR**

**Eshmuratova Maftuna Sheraliyevna**

**Annotation:** This article analyzes the problems of sugar production and population satisfaction.

**Keywords:** sugar product, production, market, sucrose.

**Introduction** Sugar is consumed by every family member almost every day. With the onset of the summer months, the work of mistresses boils from boiling in the sweet of the hand. However, we are observing that prices for certain products have risen these days. In supermarkets and markets, sugar is sold for 14-15 thousand rubles. Everyone interprets these changes in price in their own way, and we also witness that citizens are standing in turnstile queues in the markets and looking to grieve for sugar. The fact that our people are confused and buy more than necessary products, in fact, there is no reason. As for the price increase, it is not difficult to understand that the analysis of specialists in this field is caused by a number of factors, such as increased cost and external influences.

Today we knew it expediently to talk about the Sugar product produced in our country and its possibilities for delivery to the population. To this end, we were interested in getting acquainted with the activities of the Limited Liability Company "Angren sugar" in the Tashkent region, the capacity of the enterprise and the level of adequacy of the production for the need.

For technologists, the purity of the sucrose content in sugar comes first. That is, according to the requirement of the state standard, the amount of sucrose in a sugar product should not be less than 99.7 percent. At the moment, the content of sucrose in the Sugar product released at the enterprise is higher than 99.8 percent. As for the question of sweetness, such thoughts have not appeared now. Even a hundred years ago, such views existed. It's not just about Angren, Khorezm sugar, but about the sweetness of sugar produced from beets or sugar cane in the world, the debate continues among the population.

The enterprise is using all means to meet the need to organize production beyond capacity. Our goal is to provide the population with a complete and continuous supply of sugar products. We have enough raw materials and opportunities for this. A finished product is also enough in a sugar warehouse. At the same time, continuous sugar products are being supplied to the population.

I would like to emphasize that there is no reason why our people are confused. Because there are no interruptions when the plant stops or there are no interruptions in the delivery of products. As I noted above, 1100 tons of sugar are delivered to the population every day. For example, the enterprise is planned to supply 300 thousand tons of sugar per year. Currently, more than 30 thousand tons of sugar are supplied every month. I will say with confidence that there will be no problems with the production of sugar and the satisfaction of the needs of the population.

I heard about it. In fact, this opinion is not true. Somehow, I also worked for many years at the Khorezm sugar Enterprise before. LLC "Angren sugar" was launched on

German technology 2014. In it, the product is processed according to a six-crystal scheme. Khwarazm sugar started operations in 1998. It works according to the scheme of production of three products.

In fact, the purity of sucrose in sugar is considered important. The Sugar product produced at the enterprise is required by CIS standards to have a sucrose content of no less than 99.7 percent. At the enterprise, this requirement is being fulfilled.

The fact that raw materials are not grown on our own is directly related to the climate. Currently, we are receiving products from sugarcane raw materials. Sugarcane grows in subtropical regions. Our territory is not subtropical, but, on the contrary, enters the sharply continental region. Now, speaking about working from beets, in the following years there is a shortage of water not only in Uzbekistan, but also in Central Asia. Nevertheless, I hope that experts will come to a solution when it comes to growing sugar beets.
